

ESPPhone Photo Setup

Once you add the ESP to Home Assistant, go to **Devices & Services**.

Click on the **ESPPhone** device, or add it if you haven't already. Then click the **gear icon**.

Check both boxes for:

- When enabled, ESPHome devices can perform Home Assistant actions or send events. Only enable this if you trust the device.
- When enabled, the device will send logs to Home Assistant and you can view them in the Logs panel.

Then click **Submit**.

Upload the Photo

Next, go to **Settings** → **Apps**. Install or open **File Editor**.

Go to the folder selector at the top and look for the **www** folder. Upload **test.jpg** there.

Configure ESPPhone

Then go back to **Devices & Services** → **ESP** and open your **ESPPhone** device.

Look for **Display Theme** and change it to **URL Photo**.

Then look for **Display Theme Photo URL** and enter:

```
http://IP:8123/local/test.jpg
```

Replace **IP** with the IP address of your Home Assistant server.

You should now see the photo.

Image Optimization

Use the following Image Optimizer to upload and optimize the image:
